IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

(Canceled)

(Currently Amended) A reception method in a cellular radio system comprising: including, in each cell, at least one base station communicating with terminals located in its area and in which system Code Division Multiple Access is employed, wherein a received signal includes a sum signal of signals originating from several transmitters, the method comprising:

performing interference elimination and a simultaneous multi-user detection to said received signal, including

generating an estimate for the received signal, wherein the estimate includes one or more estimates of a received user signal, and the effect of the symbols estimated on the symbol level is subtracted from the received sum signal, whereby a narrowband, symbollevel residual signal is obtained,

correlating the received signal by a particular spreading code, whereby a first symbol-level signal is obtained,

correlating the computed estimate by the same spreading code, whereby a second symbol-level signal is obtained, and

subtracting the second symbol-level signal from the first symbol level signal, whereby a narrowband, symbol-level residual signal is obtained.

(Currently Amended) A method as claimed in claim 1-or 2, further comprising estimating parameters of unknown signals from the narrow-band residual signal.

\(4\) (Canceled)

(Previously Presented) A method as claimed in claim 2, further comprising detecting by means of the estimated parameters the found signals using the simultaneous multi-user detection.

(Currently Amended) A method as claimed in claim 1-or 2, further comprising first conveying the sum signal to a number of matched filters in which parameters of known signals are estimated, and said known signals are conveyed to a detector in which the simultaneous multi-user detection is performed.

15:25

5 (Previously Presented) A method as claimed in claim 6, wherein the parameters comprise the signals' phase, amplitude and spreading code used.

(Previously Presented) A method as claimed in claim & wherein the signal parameters are estimated in parallel.

(Previously Presented) A method as claimed in claim 6, wherein the signal parameters are estimated sequentially.

(Previously Presented) A method as claimed in claim & further comprising, when some parameters of the unknown signals are known, these data are utilized when other parameters are searched.

(Currently Amended) A method as claimed in claim 1 or 2, wherein the residual signal comprises user symbols and the method further comprises combining the symbols incoherently.

(Currently Amended) A method as claimed in claim 1 or 2, wherein the residual signal comprises user symbols and the method further comprises combining that the symbols are combined coherently.

(Currently Amended) A method as claimed in claim 1-or 2, further comprising estimating parameters in several stages in such a manner that preliminary estimates are searched first, whereupon a more accurate, final estimate is estimated from among found, preliminary estimates.

(Canceled)

(New) A receiver in a cellular radio system including, in each cell, at least one base station communicating with terminals located in its area, in which system Code Division Multiple Access is employed, wherein a received signal includes a sum signal of signals originating from several transmitters, said receiver comprising:

means for performing interference elimination and a simultaneous multi-user detection to the received signal, means performing interference elimination and a simultaneous multi-user detection to said received signal, including

means for generating an estimate for the received signal, wherein the estimate includes one or more estimates of a received user signal, and the effect of the symbols estimated on the symbol level is subtracted from the received sum signal, whereby a narrowband, symbol-level residual signal is obtained,
